### Examples 286 to 311

#### General Procedure

10

Compounds 286 to 311 with the exception of compound 307 were prepared following the procedure described below.

A solution of 2-[[(Butylamino)carbonyl]amino]-4-methyl-5-thiazole carboxylic acid chloride (30 mg, 0.11 mmol), appropriate amine (0.12 mmol) in THF (1 mL) was treated with diisopropylethyl amine (22.6  $\mu$ L, 0.13 mmol). The mixture was purged with argon and stirred mechanically in a vial for 22 h, diluted with dichloromethane (4 mL) and washed with 2 N aq. HCl solution (3x). The organic extract was separated, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated. The crude products were purified either by truturation with dichloromethane-ether (1:1) or by silica gel

chromatography (elution solvent: 80% EtOAc in hexanes followed by EtOAc) or by automatic preparative HPLC (conditions: YMC S5 ODS A 20 x 100 mm Column, 10 min gradient starting from 30% solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.1% TFA) and 70% solvent A (10% MeOH, 90% H<sub>2</sub>O, 5 0.1% TFA) to 100% solvent B, flow rate 20 mL/min,  $\lambda = 220$  nM. Compound 307 was prepared following the procedure described below. A suspension solution of 2-[[(Butylamino)carbonyl]amino]-4-methyl-5thiazole carboxylic acid (100 mg, 0.36 mmol), and HATU (170 mg, 0.44 mmol) in DMF (3 mL) was treated with diisopropylethyl amine (62 mL, 0.44 mmol). The mixture was heated to 60°C for 2 h, cooled, diluted with 10 dichloromethane (12 mL), washed with 8M aq. Urea solution in 2 N aq. HCl (6 mL, 3x), 5% aq. KHCO, solution (6 mL, 3x), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated. The residue was triturated with EtOAc-ether to obtain the mixed anhydride intermediate (102 mg, 74%) as a white solid. A 1 M solution of sodium bis(trimethylsilylamide) in THF (170  $\mu$ L, 0.17 mmol) 15 was added dropwise to a stirred solution of 2,6-dichloroaniline (19.4 mg, 0.12 mmol) in THF (1 mL). After 15 min, the mixed anhydride intermediate (41.3 mg, 0.11 mmol) was added in one portion. A few drops of DMF was added and the solution was stirred for 16 h. Additional 1 M solution of sodium bis(trimethylsilylamide) (110 µL) was added and the 20 mixture was stirred for additional 2 h. The mixture was diluted with dichloromethane (4 mL) and washed with 2 N aq. HCl solution (2 mL, 3x), satd. aq. KHCO, solution (3x), dried (Na, SO,), filtered and concentrated. The solid was washed with hexanes (2x) and the residue was chromatographed on a silica gel column. Elution with 80% EtOAc in 25 hexanes followed by EtOAc afforded 307 (12 mg, 27%) as a light tan solid. "HPLC Ret Time" is the HPLC retention time under the following conditions: YMC S5 ODS 4.6 x 50 mm Ballastic Column, 4 min gradient starting from 100% solvent A (10% MeOH, 90% H,O, 0.2% H,PO,) to 100% solvent B (90% MeOH, 10%  $H_2O$ , 0.2%  $H_3PO_4$ ), flow rate 4 mL/min,  $\lambda = 220$ 30 nM.

To a suspension of NaH (148mg, 6.17mmol) in THF (20mL) was added a solution of compound 315D (551mg, 2.06mmol) in THF (10mL) and stirred at RT for 0.5h. A solution of 4,6-dichloro-2-methylpyrimidine (671.6mg, 4.12mmol) in THF (10mL) and stirred at RT overnight. The reaction was quenched with acetic acid and the solvent removed in vacuo. Water and saturated NaHCO<sub>3</sub> were added to the residue and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was removed in vacuo and the crude material purified by column chromatography to give 444A (494mg).

A.

To a suspension of NaH (2.83g,118mmol) in DMF (350mL) cooled to 0°C was added compound 319A (31g, 93.5mmol). The mixture was stirred for 45min at 0°C then Bu,NI (6.9g, 18.7mmol) was added followed by addition of 4-methoxy benzylchloride (18g, 115mmol). The reaction was allowed to warm to RT. After stirring overnight at RT the reaction was quenched slowly with acetic acid then the solvent removed in vacuo. To the residue was added water and neutralized with saturated aqueous NaHCO<sub>3</sub>. The mixture was extracted 3 times with EtOAc and the combined organic layers washed with water then washed with saturated NaCl solution. The EtOAc layer was concentrated in vacuo and the residue purified by column chromatography to give 473A (35g).

To compound 473A (0.5g, 1.1mmol) dissolved in THF (50mL) was slowly added NaH (0.13g, 5.5mmol) followed by 2-bromo-6-aminopyridine (0.76g, 4.4mmol). The reaction was heated to reflux for 2h then cooled to RT and quenched with acetic acid. The solvent was removed in vacuo then water and hexane was added and stirred at RT. The solid precipitate was collected by filtration and washed with water and Et<sub>2</sub>O to give 473B (0.48g)

 $\underline{\mathbf{C}}$ 

To compound 473B (0.48g) dissolved in TFA (5mL) was added anisole (2mL) followed by triflic acid (1mL). The reaction was stirred at RT for 3h then was slowly added to a rapidly stirred mixture of ice, saturated NaHCO<sub>3</sub>, Et<sub>2</sub>O and CH<sub>2</sub>Cl<sub>2</sub>. The mixture was stirred cold for 1h then the solid precipitate was collected by filtration and washed with water followed by Et<sub>2</sub>O/CH<sub>2</sub>Cl<sub>2</sub>mixture to give 473C (0.344g). HPLC Ret. Time 3.85min.

To the mixture of methyl 4-methoxyacetoacetate (14.6 g, 0.1 moL) and formami-dine hydrogen chloride salt (16.1 g, 0.2 moL) in 70 mL of dry MeOH was added a 25% solution of sodium methoxide (70 mL, 0.3 moL) in MeOH portionwise. A white precipitate was formed immediately. The reaction mixture was stirred at room temperature for 1.0 hr. Acetic acid

Concentration in vacuo followed by flash chromatography (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc: 9:1) on silica gel gave 5.33 g of compound **501B** as a pale yellow oil.

To a solution of compound 501 (56 mg, 0.144 mmoL) in dry CH<sub>2</sub>Cl<sub>2</sub> (3.0 mL) cooled at 0.C was added neat BBr<sub>3</sub> (0.054 mL, 0.574 mmoL). The mixture was stirred for 1.0 hr at ambient temperature. MeOH was added slowly with care at 0.C and the resulting mixture was concentrated in

vacuo. Water was added to the residue and pH was adjusted to 7 with Sat'd NaHCO<sub>3</sub>. The white precipitate was collected by filtration, rinsed with water/ether and dried under high vacuum to give 52 mg of Compound **502** as an off-white solid. HPLC Retention time = 2.84 min.

To a solution of compound 520A (480 mg, 4.0 mmoL) in dry THF (10 mL) cooled at -78.C was added a 2.5M solution of n-BuLi (1.68 mL, 4.2 mmoL) in hexane dropwise via a syringe while kept the internal temperature below -75.C. Upon completion of addition, a beige suspension was obtained. The reaction mixture was stirred for 15 min at -78.C. A solution of 2-chloro-6-methyl phenyl isocyanate (0.6 mL, 4.4 mmoL) in 5 mL of dry THF was added and the reaction mixture was stirred for an additional 2.0 hrs at -78.C. Saturated aq. NH<sub>4</sub>Cl solution (10 mL) was added, the mixture was partitioned between EtOAc-water and extracted with EtOAc (x2). The combined extracts were dried over Na<sub>2</sub>SO<sub>4</sub> and concentration in vacuo to give, after recrystalization from EtOAc-hexane, 0.99 g of title compound as a pale yellow crystalline material.

## Example 528

Preparation of 2-Bromo-N-, N-(2-chloro-6-methylphenyl)-(4-methoxybenzyl)-5-thiazolecarboxamide

To a cooled (0 °C) THF solution of 2-chloro-6-methyl aniline (2.86 mL, 23.3 mmol, 1.10 equiv) was added dropwise a 1.0 M solution of lithium

15 bis(trimethylsilyl)amide (42.2 mL, 42.2 mmol, 2.00 equiv) via syringe.

The homogeneous solution was allowed to stir for 5 minutes, and then a

THF solution of ethyl 2-bromo-5-thiazolecarboxylate (5.00 g, 21.1 mmol,
1.00 equiv, prepared in a manner analogous to compound 319A) was

added via cannula. The solution was allowed to stir for 15 minutes until

20 TLC analysis showed no remaining starting material. To the reaction was
then added 4-methoxybenzyl chloride (7.15 mL, 52.7 mmol, 2.5 equiv),
followed by a catalytic amount of tetrabutylammonium iodide (1.56 g, 4.22
mmol, 0.20 equiv). The homogeneous mixture was allowed to stir
overnight at ambient temperature and then concentrated in vacuo. The

residue was partitioned between ethyl acetate and water, and the organic extracts were washed with brine and dried over Na<sub>2</sub>SO<sub>4</sub>. After filtration and removal of solvent, the product was purified by flash chromatography (10-20% ethyl acetate in hexanes) to afford the title compound as a tan solid (47%).

Compound **529** was prepared in an analogous manner to **319B**, except using **528** and 6-bromo-2-aminopyridine as the reactants.

### Example 530

Preparation of N-(2-Chloro-6-methylphenyl)-2-[(6-bromo-

2-pyridinyl)amino]-5-thiazolecarboxamide

Compound **529** (0.500 g, 0.919 mmol, 1.00 equiv) was dissolved in 5 mL trifluoroacetic acid and charged at ambient temperature with 2 mL anisole followed by 1 mL trifluoromethanesulfonic acid. The dark red homogeneous solution was allowed to stir overnight, and then quenched by carefully pouring the solution into an ice/sodium bicarbonate mixture. A white solid was filtered off and washed sequentially with water, 1:1 hexane/ether, and ether to afford the title compound (41%).

For anilines substituted with a carboxylic acid group, the reaction mixture was treated 10 with 1 N aqueous NaOH (5 eq) overnight before final purification of the product by HPLC. "HPLC Ret Time" is the HPLC retention time under the following conditions: YMC S5 OSD 4.6 x 30 mm (for 556 to 560) or YMC S7 ODS 3 x 50 mm column (for 561 to 566), 2 min gradient starting from 15 100% solvent A (10% MeOH, 90% H<sub>2</sub>O, 0.1% TFA) to 100% solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.1% TFA), flow rate 5 mL/min,  $\lambda = 220$  nM.

A mixture of 1-bromo-3-chloropropane (10 mL, 0.10 mmole), imidazole (6.81 gm, 0.10 mmole) in ethanolic NaOEt (41.3 mL, 21 wt%, 1.1 mmole) was heated at reflux for 1 hr. After cooling to RT, this was filtered and the filter cake was washed with EtOH. The solvent was removed from the filtrate to afford crude 3-chloro-1-(imidazo-1-yl)-propane as an oil. A portion of the crude chloride (1.07 gm, 7.40 mmole) was added to a mixture of 4-nitro-benzimidazole (1.09 gm, 6.66 mmole) and NaH (293 mg, 60% in oil, 8.14 mmole) in DMF (15 mL). After being heated at 60°C overnight and then 75°C for 3 hr, the solvent was removed. The residue was partitioned between water and a mixture of 10% MeOH in DCM. The organic phase was separated, dried (Na<sub>2</sub>SO<sub>4</sub>) and the solvents removed. Radial chromatography (4 mm silica gel plate that was eluted with a step gradient of DCM containing 2, 3, 4, ...10% MeOH) afforded the

major product, 1-[3-imidazo-1-ylpropyl]-4-nitro-benzimidazole as a solid (513 mg, 28%). A mixture of this material (250 mg) and 10% palladium on charcoal (200 mg) in EtOH (10 mL) under a hydrogen atmosphere (balloon) was vigorously stirred for 1 hr. Removal of the catalyst by filtration and the solvent under reduced pressure left the crude 4-amino-1-[3-imidazo-1-ylpropyl]-benzimidazole as a solid. A portion of this material (46 mg, 0.191 mmole) was added to a mixture of 319A (63 mg, 1.0 eq), an aqueous solution of HCl (0.24 mL, 1.0 M, 1.25 eq) and n-BuOH (1 mL). This was heated in a sealed vial at 120°C for 44 hr. After cooling to RT, 567 (HPLC retention time (YMC ODS S5 4.6 x 30 mm): 1.20 min) was isolated by preparative HPLC.

After cooling to RT, the reaction was filtered and the filter cake was washed with EtOH. The solvent was removed from the filtrate to afford crude 2-chloro-1-(imidazo-1-yl)-ethane. A portion of the crude

chloride (2.24 gm, 17.2 mmole) was added to a mixture of 6-nitro-indazole (1.63 gm, 10.0 mmole), K<sub>2</sub>CO<sub>3</sub> (1.50 mg, 1.1 eq), and KI (1.70 gm, 1.1 eq) in DMF (15 mL). After being heated at 70°C overnight and then 90°C for 4 hr, the solvent was removed. The residue was partitioned between water and a mixture of 5% MeOH in DCM. The organic phase was separated, 5 dried (Na SO,) and the solvents removed. Radial chromatography (4mm silica gel plate that was eluted with a step gradient of DCM containing 0, 1. 2% MeOH) afforded 659 mg of 1-[2-imidazo-1-ylethyl]-6-nitro-indazole and 450 mg of the isomeric 2-[2-imidazo-1-ylethyl]-6-nitro-indazole. A 10 mixture of 1-[2-imidazo-1-ylethyl]-6-nitro-indazole (650 mg) and 10% palladium on charcoal (600 mg) in EtOH (10 mL) under a hydrogen atmosphere (balloon) was vigorously stirred overnight. Removal of the catalyst by filtration and the solvent under reduced pressure left the crude 6-amino-1-[2-imidazo-1-ylethyl]-indazole as a solid. A portion of this material (68.1 mg, 1.5 eq) was added to a mixture of 556 (99.3 mg, 0.300 15 mmole), an aqueous solution of HCl (0.45 mL, 1.0 M, 1.5 eq) and n-BuOH (1.5 mL). This was heated in a sealed vial at 120°C for 44 hr. After cooling to RT, 568 (HPLC retention time (YMC ODS S7 3 x 50 mm): 1.31 min) was isolated by preparative HPLC.

A mixture of 2-chloro-5-nitro-benzimidazole (985 mg, 5.0 mmole) and 1-(3-aminopropyl)-imidazole (1.8 mL, 3 eq) in toluene (15 mL) was heated at reflux for 5 hr. The reaction was partitioned between EtOAc and brine to give a precipitate that was collected by filtration. Flash chromatography of this material (silica gel; stepwise gradient elution with mixtures of DCM containing 1, 2, 3,...10% MeOH) afforded 2-[3-[imidazo-1-yl]-propylamino]-5-nitro-benzimidazole (550mg) as a solid. This material was combined with 10% Pd on charcoal (500 mg), suspended in EtOH, and stirred under a hydrogen atmosphere (balloon) overnight. Removal of the catalyst by filtration and the solvent under reduced pressure left the crude 5-amino-2-[3-imidazo-1-ylpropylamino]- benzimidazole as a solid. A portion of this material (77 mg, 0.30 mmole) was added to a mixture of 319A (99 mg, 1.0 eq), an aqueous solution of HCl (0.60 mL, 1.0 M, 2 eq) and n-BuOH (1.5 mL). This was heated in a sealed vial at 120°C for 20

A mixture of 3,4-diamino-nitrobenzene (15.3 g, 0.10 mole) and chloroacetic acid (14.18 gm, 1.5 eq) in 5.0 N aqueous HCl (80 mL) was heated at reflux 10 for 1 hr. After cooling to RT, the reaction was filtered through celite and the filtrate was stored at 0°C for 2 days. The crystals that formed, were collected and recrystallized from a mixture of EtOH and water to give 7.2 gm of the hydrogen chloride salt of 2-chloromethyl-5-nitro-benzimidazole. A portion of this salt (528 mg, 2.13 mmole) and morpholine (1.31 mL, 7 eq) 15 in toluene (15 mL) were heated at reflux for 4 hr. After cooling to RT, the reaction was filtered and the filter cake was washed with toluene. The solvent was removed from the filtrate to leave the crude 2-[Nmorpholinylmethyl]-5-nitro-benzimidazole as an oil. A portion of this material (657 mg) and 10% palladium on charcoal (650 mg) in EtOH (10 20 mL) was stirred overnight under a hydrogen atmosphere (balloon). Removal of the catalyst by filtration and the solvent left the crude 5-
